REDUCING INFECTION RISKS – HOW MICRONAIR CABIN AIR FILTERS EFFECTIVELY CONTRIBUTE TO REDUCING HEALTH RISKS ASSOCIATED WITH THE SARS-COV-2 VIRUS

The World Health Organization (WHO) declared the SARS-CoV-2 virus to be a pandemic in mid-March 2020. At present, it is still not possible to estimate when an effective vaccine may be developed. Even assuming this is achieved, we cannot know how effective it will be nor what role it might play in the years ahead. For this reason, we have to assume that SARS-CoV-2 will remain active in the future.

Against this background, we need to consider how to effectively mitigate the potential risk that the virus presents in our daily lives. One area in which viral transmission has always been high is inside vehicles. Confined spaces and close human proximity are well known to increase the risk of passing on viruses. For this reason, ensuring the cleanest possible air inside vehicle cabins has to be a priority.

Back in April, we published general guidance on this theme in our “Cabin air filter protection guidelines against COVID-19 health threats” information sheet. This covered such areas as infection paths and the behavior of viruses on surfaces. The most up-to-date research supports the statements made in this document concerning the use of our premium micronAir® blue cabin air filters to reduce the risk of infection.

Understanding corona viruses

Corona viruses expelled when breathing, sneezing or coughing are passed initially from human to human by droplets. According to current studies, apart from quantity the size of the related airborne aerosol particles also varies significantly depending on the person and can be anything from 0.05 μm to 16 μm .

These viral droplets and aerosols (droplet nuclei) can be either directly absorbed by people or ingested via secondary contamination via the viral bio-burden released into the air again through changing operating conditions and vehicle vibrations.

MICRONAIR BLUE WITH ANTI-VIRAL PROPERTIES: FOUR-LAYER FILTRATION FOR MAXIMUM PROTECTION

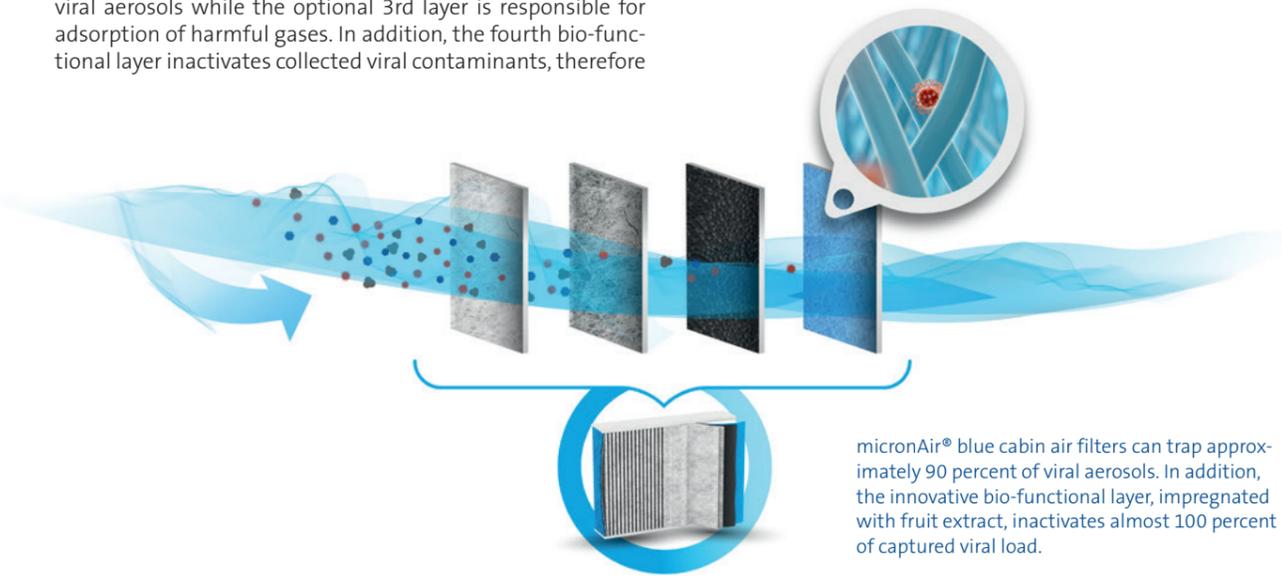

micronAir® blue cabin air filters provide active protection by significantly reducing the concentration of viral aerosols. This is achieved by a unique multi-layer design that effectively filters, captures and suppresses noxious environmental gases as well as inorganic and biological particles and aerosols.

The fine particle filtration layers in the premium micronAir® blue cabin air filters provide decisive protection against virus transmission. They demonstrably separate not only droplets (> 5 µm), but also critical viral aerosols (droplet nuclei significantly below 5 µm).

The first two layers thus capture the majority of ultra-fine viral aerosols while the optional 3rd layer is responsible for adsorption of harmful gases. In addition, the fourth bio-functional layer inactivates collected viral contaminants, therefore

effectively suppresses the release of active viruses back into the cabin air. This has been conclusively proved by a comprehensive series of tests conducted at an independent external institute, specialized in microbiological analysis.

The high particulate and viral aerosol filtration performance is sufficient to significantly reduce the concentration of airborne viral aerosols. In this way, micronAir® blue cabin air filters make a substantial contribution to minimizing the risk of virus transmission inside vehicles.

RECOMMENDATIONS FOR MINIMIZING RISK INSIDE THE VEHICLE CABIN

- **Increased fresh air supply** is an efficient way to protect against viruses inside vehicles. This maximizes the dilution of airborne aerosols.
- **The efficiency of the filter elements** plays a vital role in filtering out environmental contaminants, harmful substances and pathogenic aerosols. In recirculation mode, the viral air-cleaning performance depends heavily on the viral filtration efficiency of the filtration system and the air exchange rate.

micronAir® blue cabin air filters reliably capture viral aerosols with their unique progressive multi-layer design and prevent the viral re-aerosolization.

We recommend indicating the following:

micronAir® blue with surface disinfection properties by means of a functional filter layer based on fruit extract (active ingredient CAS-Nr. 77-92-9 and/or 5949-29-1) for use in air handling/air conditioning systems: Bacteriostatic and fungistatic surface disinfection properties against a multitude of gram-positive and gram-negative bacteria, yeast and fungi as well as viral surface disinfection properties (excellent antiviral efficacy for influenza virus H1N1 and corona virus HCoV 229E according to ISO 18184:2019) to prevent viral re-aerosolization.

The safest choice – now and in the future

The SARS-CoV-2 virus is just the latest of an unbroken line of viruses stretching back through human history. Even when it finally disappears, others will evolve to replace it. In terms of mitigating risk while travelling in motor vehicles, there is currently no better protection than the advanced micronAir® blue cabin air filters.

- **Innovative filter elements with surface disinfection properties** efficiently prevent viral re-aerosolization while ensuring the highest level of protection of human health and the environment.
- **Filter service:** Especially under current conditions, the cabin air filter should be **changed more frequently than usual** to maintain optimum protection.

Legal conformity

The bio-functional layer in micronAir® blue cabin air filters is able to inactivate harmful organisms. Unlike traditional chemical biocides, many of which are already banned for use in vehicles or labeled "to be substituted", the fruit extract used conforms to the latest European Biocide Directive (BPR).

In accordance with the stipulations of the BPR, where they are used, end-consumers must be informed that micronAir® blue cabin air filters are a "treated article" with biocidal properties.

About the European Biocide Directive (BPR)

The BPR is intended to regulate biocidal products that may pose risks to humans, animals and the environment. The directive (Regulation (EU) No. 528/2012) regulates the marketing and sale of biocidal products intended to protect humans, animals, materials or products against harmful organisms such as bacteria and viruses. The aim of the BPR is to strengthen the biocidal products market in the EU while ensuring a high level of protection for human health and the environment.
